

IN THE SPECIFICATION

Please amend the abstract as follows:

A predistortion circuit has an input terminal for inputting a predetermined signal; a nonlinear device directly or indirectly connected to the input terminal; a bias supply circuit for applying a voltage to the nonlinear device; ~~a~~ specific-frequency suppressing ~~means~~ device connected to one side or both sides of the nonlinear device directly without another intervening device ~~and of~~ for suppressing all or part of such frequencies that are from a frequency corresponding to DC to a frequency corresponding to an occupied band width of an input signal inputted to the input terminal and/or suppressing at least one higher harmonic frequency of a carrier wave of the input signal; and an output terminal for outputting a signal.
